*CVault Stability Study
Summary Report
April 29, 2013*

The graph to the left depicts how no THC was lost on the plant material kept inside of the CVault®.

Differences in plant material sampling and variability can explain the slight fluctuations, and linear trend lines are used to describe the data to make it easier to interpret. There is no significant loss of THC in the CVault® over 160 days of storage.

Conclusion:

Medical cannabis stored in the CVault® remains exceptionally stable over long periods of time as exhibited by this independently performed study that lasted 168 days. Minimal weight loss due to evaporation of water was observed and no THC loss was shown to occur.
